github.com/eFurkanSngl

CORE SKILLS

- Unity Engine (C#)
- OOP & SOLID Principles
- Event-Driven Architecture
- Object Pooling & GC Opt.
- ScriptableObject Design
- Mobile Optimization
- Zenject (DI Framework)
- DOTween Animations
- Game Feel & Polish
- Android Build Pipeline
- UI System & Cinemachine
- Unity Profiler & Debugging
- Git / GitHub Workflow
- Google Play Console

LANGUAGES

Turkish — Native
English — Working Proficiency

PROFESSIONAL SUMMARY

- Unity (C#) game developer specializing in mobile puzzle and casual games with a strong focus on Android platform performance.
- Expertise in scalable, modular architectures using OOP/SOLID, event-driven systems, Zenject DI, and ScriptableObject design patterns.
- Proven track record in GC optimization, object pooling, DOTween animation, and gameplay feel & polish.
- Experienced across the full delivery cycle: prototyping, performance profiling, Google Play release, and Git-based team workflows.

PROFESSIONAL EXPERIENCE

Junior Game Developer

Virtual Projects

11/2025 – 04/2026 | Istanbul, Turkey

- Developed mobile puzzle gameplay features in Unity (C#), including Block Sort-style mechanics and match-based board systems.
- Led level design, puzzle stage flow, and gameplay balancing to improve player progression quality.
- Implemented and iterated core gameplay loops, level interactions, and UI-linked gameplay logic for production-oriented releases.
- Drove gameplay polish passes covering animation, VFX, and feel tuning, alongside performance optimization.
- Contributed to release-readiness, bug-fix iterations, and team delivery using Git/GitHub task-based workflows.

Intern Game Developer

Virtual Projects

06/2025 – 10/2025 | Istanbul, Turkey

- Built and polished gameplay systems for internal prototypes, including Royal Match and This Is Blast-inspired implementations.
- Implemented core mechanics, board/game flow, and UI interactions using a modular, maintainable C# architecture.
- Improved animation runtime performance by ~20% through DOTween optimization and efficient tween lifecycle management.

Intern Game Developer

Ice Frost

02/2024 – 09/2024 | Istanbul, Turkey

- Developed two mobile puzzle games (FunnyMatchThree & Flipit) in Unity (C#) from concept to delivery.
- Applied OOP principles to build clean, maintainable, and performance-aware codebases under senior developer supervision.
- Gained hands-on experience with object pooling, event-driven systems, and optimized game flow for mobile targets.

TECHNICAL SKILLS

Architecture & Patterns

- OOP / SOLID / Clean Code
- Event-Driven Architecture
- Dependency Injection (Zenject)
- Object Pooling & GC Optimization
- ScriptableObject Data Architecture
- Singleton / Observer / SignalBus

Engine & Tools

- Unity Engine — Animation, UI, Audio
- DOTween / Cinemachine
- Odin Inspector / Unity Profiler
- Git / SourceTree / GitHub
- Google Play Console & SDK
- Android Build Pipeline

TOOLS & TECHNOLOGIES

- Zenject / SignalBus
- DOTween
- Odin Inspector
- Unity Profiler
- SourceTree / Git
- Google Play Console
- Google SDK Integration
- Android Build Pipeline
- Cinemachine
- Unity Particle System
- Unity Audio System
- UnityAction / UnityEvent

PROGRAMMING

C# — Intermediate
Python — Basic
JavaScript — Basic

AI-ASSISTED DEV

Claude (Anthropic)
ChatGPT / OpenAI Codex
Debugging, refactoring & implementation planning

WHAT I BRING

- Production-ready mobile code
- Clean, reviewable architecture
- Self-driven delivery & polish
- Fast iteration under deadline
- Strong debugging mindset
- Passion for game feel & UX

SOFT SKILLS

- Team collaboration (Git flow)
- Task-based async delivery
- Rapid prototyping
- Performance-first mindset

PROJECT EXPERIENCE

Color Blast Match — Mobile Puzzle

03/2026 – 04/2026

- Built complete grid-based match puzzle systems: board flow orchestration (match clear gravity refill) with safe callback sequencing.
- Developed data-driven level setup via ScriptableObject (LevelData) with a custom Level Authoring Tool.
- Integrated modular power-ups (Rocket, Bomb, Rainbow, Hammer) and event-driven UI/gameplay flow.
- Improved mobile runtime stability with object pooling, tween lifecycle control, and lock/guard-based state safety.

Tech: Unity, C#, Zenject, DOTween, ScriptableObject, Event-Driven Architecture, Object Pooling, Git

Fill The Blocks — Google Play & Web

01/2026 – 03/2026

- Designed a data-driven block framework using ScriptableObjects with separated runtime grid state.
- Built modular gameplay systems with OOP/SOLID principles, polymorphism, and event-driven architecture for zero-modification extensibility.
- Optimized performance via object pooling, HashSet-based cell tracking, localized grid validation, and ghost placement optimization.
- Enhanced game feel through animation flow, particle pooling, and centralized audio & haptic service; integrated Cinemachine camera effects.
- Prepared for Google Play release: mobile optimization, SDK integration, and ad monetization setup.

Tech: Grid Architecture, OOP/SOLID, Event-Driven, Object Pooling, Mobile Optimization, Cinemachine

DoubleTake — AI Personalized Puzzle (Freelance)

01/2026 – 03/2026

- Delivered a spot-the-difference puzzle game with a full gameplay loop: difference detection, level runtime, hints/lives systems, and player progression.
- Built a custom hint-focus system using shader-based spotlight effects and an AI avatar pipeline (photo upload backend generation local persistence).
- Integrated coin economy, IAP-ready SKU structure, in-game store flow, and rewarded hint systems on a scalable mobile codebase.

Tech: Unity, C#, Shader Effects, IAP, Event-Driven Architecture

This Is Blast Clone

07/2025 – 08/2025

- Implemented modular Blast-style architecture with OOP/SOLID and fully decoupled Zenject SignalBus event system.
- Reduced GC allocations by ~30% through Object Pooling and ScriptableObject-driven grid/level data structures.
- Designed squash-and-push bullet mechanics with camera shake, bounce animations, haptics, particles, and SFX.

Tech: Unity, C#, Zenject, SignalBus, DOTween, Object Pooling, ScriptableObject

Royal Match Clone

06/2025 – 07/2025

- Built Match-3 core with optimized detection for 3-line, 2x2, L and T shapes — scanning only moved tiles for better performance.
- Implemented five power-up types (Horizontal/Vertical Rocket, Bomb, Light Bomb, Propeller) and a dynamic obstacle system.
- Used Zenject DI and Object Pooling for Tiles and Obstacles; SRP/OCP-compliant architecture with event-driven score & UI logic.

Tech: Unity, C#, Zenject, DOTween, Object Pooling, Match-3 Algorithms

Flip It!

05/2025 – 06/2025

- Designed end-to-end with modular OOP/SOLID architecture and centralized game flow management.
- Built a flexible power-up system using abstract/virtual class hierarchy (OCP-aligned); event-driven communication across UI, card logic, and scoring.
- Developed object pooling for card/particle systems, adaptive mobile UI (Safe Area / Aspect Ratio), and persistent PlayerPrefs data.

Tech: Unity, C#, OOP/SOLID, Object Pooling, Event-Driven, DOTween
