PROFESSIONAL SUMMARY

Junior Unity Game Developer with a strong C#-centric development approach and hands-on experience developing mobile puzzle and casual games using Unity. Focused on Android platform optimization, performance stability, memory management, and gameplay responsiveness. Experienced in building clean, modular, and scalable architectures using OOP and SOLID principles, event-driven systems, and Object Pooling, with strong attention to GC optimization, debugging, and profiling. Comfortable with Git workflows, build preparation, and gameplay polish processes. Focus Areas: Mobile Puzzle Game Development, Scalable Unity Architecture (OOP/SOLID), Event-Driven Systems, Performance Optimization, Object Pooling, Game Feel & Polish

PROFESSIONAL EXPERIENCE

Jr. Game Developer, Virtual Projects

11/2025 – 04/2026
İstanbul, Türkiye

- Worked on mobile puzzle gameplay features in Unity (C#), including Block Sort-style mechanics and match-based systems.
- Contributed to level design, puzzle stage flow, and gameplay balancing to improve progression quality.
- Implemented and iterated core gameplay flow, level interactions, and UI-linked gameplay logic for production-oriented puzzle work.
- Collaborated on gameplay polish (animation, VFX, feel tuning) and supported performance-focused optimization passes.
- Contributed to release-readiness processes, bug-fix iterations, and team delivery in a Git/GitHub task-based workflow.

Intern Game Developer, Virtual Projects

06/2025 – 10/2025
İstanbul, Türkiye

- Developed and polished gameplay systems for internal prototypes and clone projects, including Royal Match-inspired and This Is Blast-inspired implementations.
- Implemented core mechanics, board/game flow, and UI interactions with modular C# structure.
- Improved animation runtime performance by approximately 20% through DOTween optimization and efficient tween lifecycle usage.

Intern Game Developer, Ice Frost

02/2024 – 09/2024

- Developed two mobile puzzle games using Unity (C#): FunnyMatchThree & FlipIt.
- Worked on core gameplay mechanics with a focus on clean, maintainable code following OOP principles.
- Gained hands-on experience with performance-aware development in Unity, including object pooling, event-driven structures, and optimized game flow.
- With careful supervision of a senior developers.

TECHNICAL SKILLS

Game Development

Level Design, Gameplay Systems, Game Mechanics, Game Feel & Polish, Mobile Game Optimization, Performance Optimization, 2D/3D Development.

Architecture and Patterns

Object-Oriented Programming (OOP), SOLID Principles, Clean Code, Event-Driven Architecture, Data-Driven Design, Modular Architecture, Dependency Injection (Zenject), Object Pooling, Singleton Pattern, Observer Pattern.

Tools and Technologies

Zenject, DOTween, Git, Odin Inspector, SourceTree, Google Play Console, Android Build Pipeline, Unity Profiler, Services/SDK: Google Play Console, Google SDK integrations,

Game Engine: Unity Engine

Unity Animation System, Unity UI System, ScriptableObject Architecture, Cinemachine, Unity Event System (UnityAction/UnityEvent), Particle System (VFX), Audio System, Mobile Build Optimization.

Programming

C# (Intermediate), Python (Basic), JavaScript (Basic)

AI-Assisted Development

OpenAI Codex, ChatGPT (GPT), Claude (debugging support, implementation planning, refactor ideation, documentation)

CERTIFICATES

Game Developer Certificate

March 2024 - August 2024

- Completed 240 hours of technical training (synchronous and asynchronous) and 50 hours of career and professional development.
- Advanced Unity and C# modules included OOP, modular architecture, event-driven systems, and applied project development, finalized with a hands-on graduation project.

C# & Unity - Udemy 2D and 3D Game

April 2024

Unity Essentials Pathway

January 2025

Turkcell Geleceği Yazanlar

February 2025 Unity 101

Coding for Everyone - TOBETO

Completed 34 hours of training covering console programming, algorithms, Microsoft SQL Server database fundamentals, C# Object-Oriented Programming (Beginner to Advanced), basic JavaScript, and advanced Excel.

Turkcell Geleceği Yazanlar

March 2025 C# 101

Python I & II - CISCO Networking Academy

May 2024

Mutfak Sanatları Eğitimi (Aşçılık)

İstanbul Gelisim University 2019-2021

C# - BTK Akademi

July 2023

Python - BTK Akademi

March 2023

C# - Udemy

September 2023

PROJECT EXPERIENCE

Color Blast Match, Mobile Puzzle 	03/2026 – 04/2026
• Built core gameplay systems for a grid-based match puzzle game in Unity/C#. • Implemented board flow orchestration (match -> clear -> gravity -> refill) with safe callback sequencing. • Developed data-driven level setup via ScriptableObject (LevelData) and a custom Level Authoring Tool. • Integrated modular power-ups (Rocket, Bomb, Rainbow, Hammer) and event-driven UI/gameplay flow. • Improved mobile runtime stability with object pooling, tween lifecycle control, and lock/guard-based state safety. • Technologies: Unity, C#, Zenject, DOTween, ScriptableObject, Event-Driven Architecture, Object Pooling, Git	
Fill The Blocks , Google Play & Website 	01/2026 – 03/2026
• Developed a grid-based mobile puzzle game focusing on scalable architecture, performance optimization, and production-ready systems. • Designed a data-driven block framework using ScriptableObjects with separated runtime grid state. • Built modular gameplay systems using OOP/SOLID principles, polymorphism, and event-driven architecture to enable extensibility without modifying core logic. • Optimized performance through object pooling, HashSet-based cell tracking, localized grid validation, and ghost placement optimization. • Improved game feel through animation flow, particle pooling, and a centralized audio & haptic service architecture, alongside Cinemachine camera effects. • Prepared the project for Google Play including mobile optimization, SDK integration, and ad monetization setup. • Technologies: Grid Architecture, OOP/SOLID, Event Driven, Performance, Object Pooling, Mobile Optimization, Game Feel	
DoubleTake – AI Personalized Mobile Puzzle Game 	01/2026 – 03/2026
Freelance Project & Gameplay • Developed and shipped a personalized spot-the-difference puzzle game where players identify visual differences between two scene images. • Built a modular, event-driven Unity architecture covering the full gameplay loop including difference detection, level runtime, hints/lives systems, and player progression. • Implemented a custom hint-focus system using shader-based spotlight effects and an AI avatar pipeline (photo upload → backend generation → local persistence) to integrate personalized player characters into gameplay scenes. • Integrated monetization foundations including coin economy, in-game store flow, IAP-ready SKU structure, and rewarded hint systems while maintaining a scalable, performance-oriented mobile codebase. • (Freelance project – code not publicly available due to client ownership)	
This is Blast Clone & Game code 	07/2025 – 08/2025
• Built a modular and scalable Blast-style gameplay architecture using OOP/SOLID principles with a fully decoupled Zenject SignalBus event system. • Implemented Object Pooling and a ScriptableObject-driven grid and level data structure to optimize memory usage, tile spawning, and Android runtime performance, reducing GC allocations by approximately 30%. • Designed a squash and push bullet mechanic delivering a cartoonish yet physical impact feel, enhanced with camera movement, bounce animations, haptics, particles, and SFX. • Delivered a highly polished prototype featuring smooth DOTween animations, responsive UI transitions, and extensible, production-ready systems suitable for real production pipelines.	
Royal Match Clone & Game Code 	06/2025 – 07/2025
• Built a Royal Match-style Match-3 core with optimized detection for 3-line, 2x2 square, L and T shapes, checking only moved tiles for better performance. • Implemented multiple power-ups (Horizontal/Vertical Rocket, Bomb, Light Bomb, Propeller) and an obstacle system that dynamically blocks tile falling and pathing. • Used Zenject dependency injection and Object Pooling to manage Tiles and Obstacles, creating a modular, scalable and SRP/OCP-compliant architecture with event-driven score & UI logic. • Enhanced game feel with DOTween-based squash & stretch animations, smooth UI transitions and complete SFX integration for all power-up and match events.	
Flip It! 	05/2025 – 06/2025
• Designed and developed the project end-to-end with a modular OOP/SOLID-compliant architecture and central game flow management. • Built a flexible power-up system using abstract/virtual class structure, enabling extension without modifying core logic (OCP-aligned). • Implemented event-driven gameplay communication across UI, card logic, scoring, and game states. • Developed object pooling for card/particle systems and adaptive mobile UI (Safe Area / Aspect Ratio) with persistent PlayerPrefs data.
